### Question 1

Correct

Mark 10.00 out of 10.00

This challenge is part of a tutorial track by [MyCodeSchool](#) and is accompanied by a video lesson.

Given a pointer to the head of a singly-linked list, print each *data* value from the reversed list. If the given list is empty, do not print anything.

#### Example

*head\** refers to the linked list with *data* values  $1 \rightarrow 2 \rightarrow 3 \rightarrow \text{NULL}$

Print the following:

3  
2  
1

#### Function Description

Complete the *reversePrint* function in the editor below.

*reversePrint* has the following parameters:

- *SinglyLinkedListNode pointer head*: a reference to the head of the list

#### Prints

The *data* values of each node in the reversed list.

#### Input Format

The first line of input contains *t*, the number of test cases.

The input of each test case is as follows:

- The first line contains an integer *n*, the number of elements in the list.
- Each of the next *n* lines contains a data element for a list node.

#### Constraints

- $1 \leq n \leq 1000$
- $1 \leq \text{list}[i] \leq 1000$ , where *list*[*i*] is the *i*<sup>th</sup> element in the list.

#### Sample Input

```
3
5
16
12
4
2
5
3
7
3
9
5
5
1
18
3
13
```

#### Sample Output

```
5
2
4
12
16
9
3
7
13
3
18
1
5
```

**Explanation**

There are three test cases. There are no blank lines between test case output.

The first linked list has **5** elements: **16** → **12** → **4** → **2** → **5**. Printing this in reverse order produces:

```
5
2
4
12
16
```

The second linked list has **3** elements: **7** → **3** → **9** → *NULL*. Printing this in reverse order produces:

```
9
3
7
```

The third linked list has **5** elements: **5** → **1** → **18** → **3** → **13** → *NULL*. Printing this in reverse order produces:

```
13
3
18
1
5
```

**For example:**

| Input | Result |
|-------|--------|
| 3     | 5      |
| 5     | 2      |
| 16    | 4      |
| 12    | 12     |
| 4     | 16     |
| 2     | 9      |
| 5     | 3      |
| 3     | 7      |
| 7     | 13     |
| 3     | 3      |
| 9     | 18     |
| 5     | 1      |
| 5     | 5      |
| 1     |        |
| 18    |        |
| 3     |        |
| 13    |        |

| Input | Result |
|-------|--------|
| 3     | 17     |
| 3     | 1      |
| 11    | 11     |
| 1     | 15     |
| 17    | 11     |
| 3     | 12     |
| 12    | 14     |
| 11    | 15     |
| 15    | 7      |
| 4     | 5      |
| 5     |        |
| 7     |        |
| 15    |        |
| 14    |        |

**Answer:** (penalty regime: 0 %)

Reset answer

```

1  #include <bits/stdc++.h>
2
3  using namespace std;
4
5  class SinglyLinkedListNode {

## Question 2

Correct

Mark 10.00 out of 10.00

Alexa has two stacks of non-negative integers, stack  $a[n]$  and stack  $b[m]$  where index  $0$  denotes the top of the stack. Alexa challenges Nick to play the following game:

- In each move, Nick can remove one integer from the top of either stack  $a$  or stack  $b$ .
- Nick keeps a running sum of the integers he removes from the two stacks.
- Nick is disqualified from the game if, at any point, his running sum becomes greater than some integer  $maxSum$  given at the beginning of the game.
- Nick's *final score* is the total number of integers he has removed from the two stacks.

Given  $a$ ,  $b$ , and  $maxSum$  for  $g$  games, find the maximum possible score Nick can achieve.

### Example

$a = [1, 2, 3, 4, 5]$

$b = [6, 7, 8, 9]$

The maximum number of values Nick can remove is **4**. There are two sets of choices with this result.

1. Remove **1, 2, 3, 4** from  $a$  with a sum of **10**.
2. Remove **1, 2, 3** from  $a$  and **6** from  $b$  with a sum of **12**.

### Function Description

Complete the `twoStacks` function in the editor below.

`twoStacks` has the following parameters: - `int maxSum`: the maximum allowed sum

- `int a[n]`: the first stack

- `int b[m]`: the second stack

### Returns

- `int`: the maximum number of selections Nick can make

### Input Format

The first line contains an integer,  $g$  (the number of games). The  $3 \cdot g$  subsequent lines describe each game in the following format:

1. The first line contains three space-separated integers describing the respective values of  $n$  (the number of integers in stack  $a$ ),  $m$  (the number of integers in stack  $b$ ), and  $maxSum$  (the number that the sum of the integers removed from the two stacks cannot exceed).
2. The second line contains  $n$  space-separated integers, the respective values of  $a[i]$ .
3. The third line contains  $m$  space-separated integers, the respective values of  $b[i]$ .

### Constraints

- $1 \leq g \leq 50$
- $1 \leq n, m \leq 10^5$
- $0 \leq a[i], b[i] \leq 10^6$
- $1 \leq maxSum \leq 10^9$

### Subtasks

- $1 \leq n, m, \leq 100$  for 50% of the maximum score.

### Sample Input 0

```
1
5 4 10
4 2 4 6 1
2 1 8 5
```

### Sample Output 0

```
4
```

Explanation 0

The two stacks initially look like this:

The image below depicts the integers Nick should choose to remove from the stacks. We print **4** as our answer, because that is the maximum number of integers that can be removed from the two stacks without the sum exceeding  $x = 10$ .

(There can be multiple ways to remove the integers from the stack, the image shows just one of them.)

For example:

| Input   | Result        |
|---|---------------|
| 1<br>5 4 10<br>4 2 4 6 1<br>2 1 8 5   | 4             |
| 3<br>7 2 668<br>12 54 75 66 99 22 66<br>93 32<br>3 10 541<br>34 60 55<br>47 68 67 23 18 99 24 39 56 12<br>5 7 580<br>29 21 75 81 73<br>42 32 49 22 48 91 67 | 9<br>11<br>11 |
